Our Packaging Concept

In order to fulfil the greatly increased requirements concerning packaging and environmental aspects, we introduced a new future-orientated packaging concept for Giroform reels at the end of the 80's. The performance of our packaging has been tried and tested in exhaustive international trials.

The advantages of our new packaging continue to lead the way – even after the introduction to lead the way – even after the introduction of strict new packaging legislation in Germany. Our packaging guarantees optimum handling at all stages and is based on two aims:

To Provide Perfect Protection

- the paper is sealed under ideal climatic conditions in our production plant
- optimum protection of the paper during transportation and storage is guaranteed

To Protect the Environment

- all materials used may be easily separated
- all materials may be easily collected
- all materials may be recycled
- all materials are easy to dispose of
- the minimum number of different materials are used
- the very minimum amount of packaging weight and volume is used

Our packaging offers important advantages in comparison to conventional packaging methods – these are demonstrated during paper distribution and processing:

Ideal Paper Conditioning

All Giroform reels are stretchwrapped under ideal production conditions. The PE packaging film used is environmentally-friendly. The film may be easily removed, has a low volume for collection and, when sorted, is suitable for recycling.

Complete Protection Against Impact and Moisture

The construction of our pallets guarantees all-round protection against moisture and mechanical damage during transportation.

Discs for easier pushing-off

Our new cardboard discs prevent this type of damage and enable individual Giroform reels to be safely removed from the stack.

Paper Colour – Always Visible

The colour of the paper is clearly visible from all sides in paper warehouses.

Makeready allowance for Giroform – Security For You

Every reel of Giroform paper includes a specially guaranteed additional length covering the discolorations on the perimeter normally attributable to handling the reel. As a result, you can set up your machine without any loss of paper.

Optimum Selection of Packaging Materials – No Dusting

With respect to the packaging materials used:

- a. concerning characteristics: maximum protection
- b. concerning materials: only the minimum number of different materials

Safe Synthetic Strapping

The PET pallet strapping band used may be removed without danger.

The banding may be recycled when sorted and collected.

Packaging Materials Optimised for Sorting and Collection

Adhesive materials are not used, no kraft paper, no gluing strips, no hot-melt adhesives, removable self-adhesive labels.

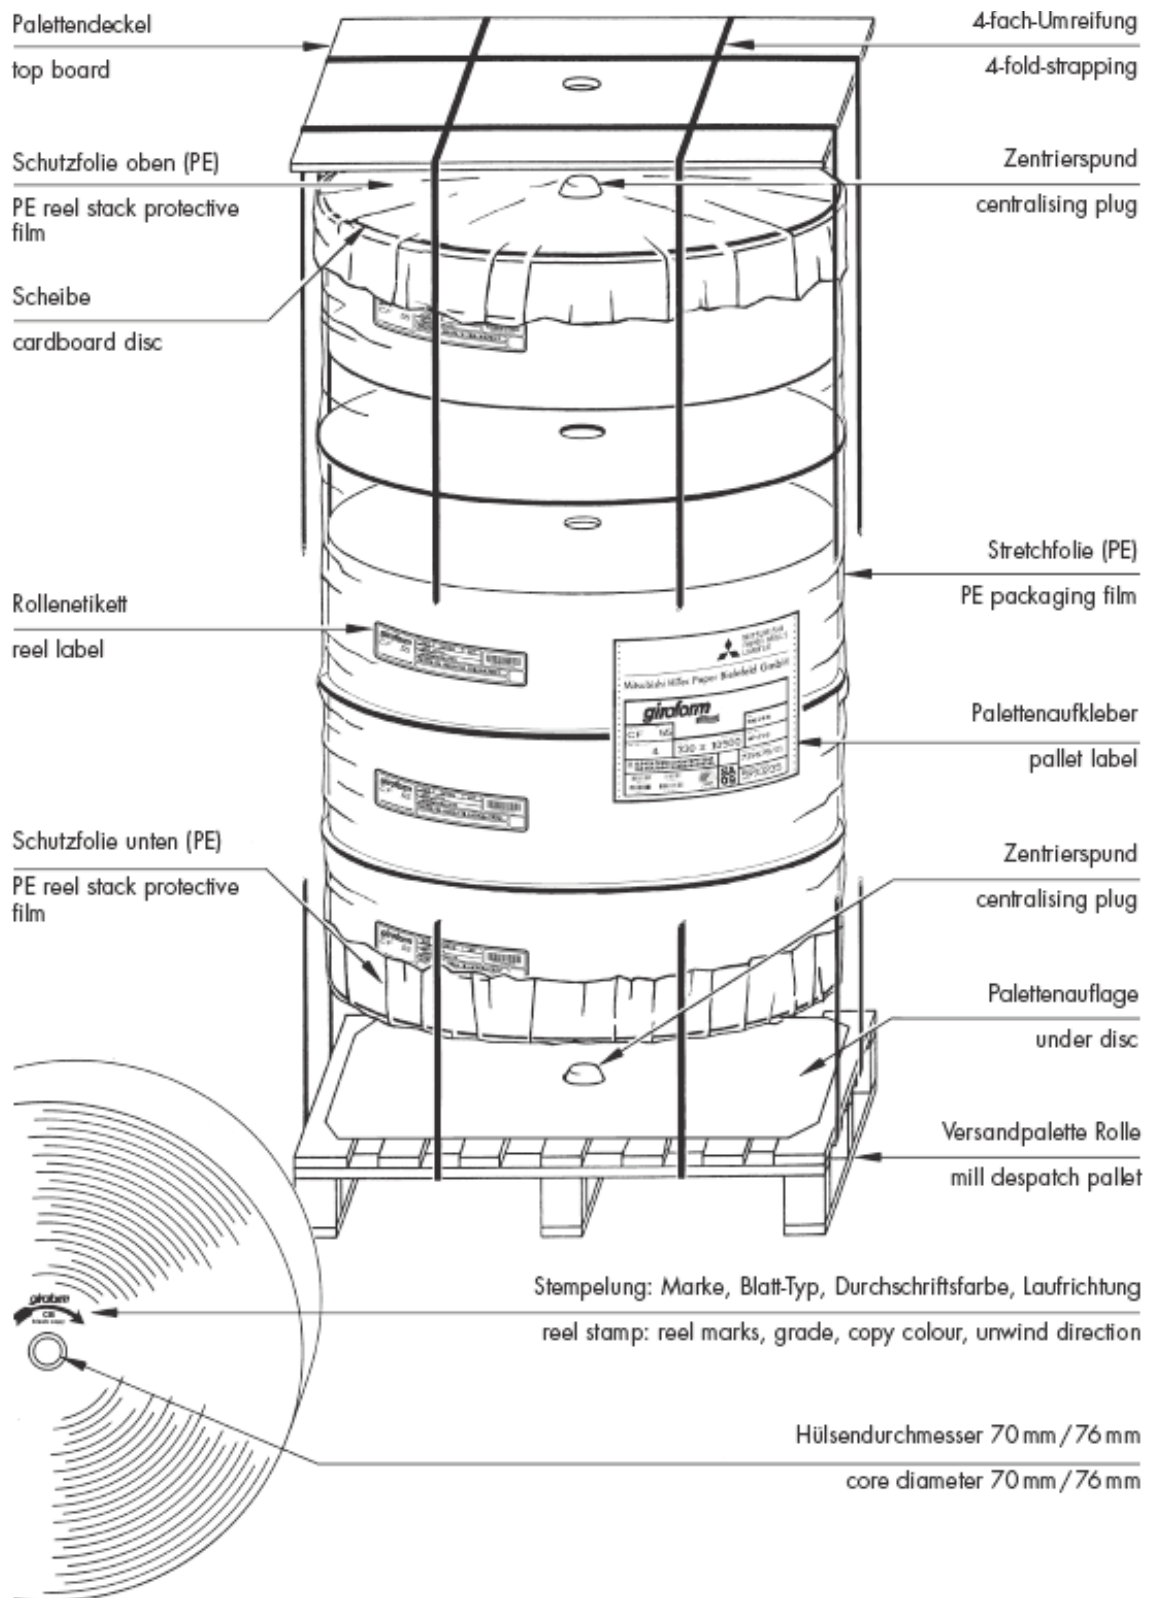

A Minimum Amount of Packaging Material and Volume

The amount and volume of packaging materials used has been reduced to an absolute minimum.

Collection Service for Pallets and Top Boards

A free-of-charge collection service is in operation in Germany which guarantees multiple use of these packaging materials. Should complete truck loads be held for collection, it is also possible for us to make collections from our export markets. Please contact our sales department and request our brochure concerning collection.

Reel Packing

1. Standard Pallets

We are the only company to supply the complete makeready allowance of at least 30 turns for CB 54 g/qm, CFB 53 qm and CF qm. The allowance is adjusted proportionally for other grammages.

- pallet to top board
- protective cardboard discs between all reels – including the top reel in the stack to protect against dust and help in safe removal from the stack
- all reel and pallet labels may be removed from the PE protective film
- self-adhesive tapes or similar materials are no longer used. Reel stack cores are also no longer used.
- protective film is used at the top and bottom of the reel stack. The stacks are stretch wrapped in climatically secure PE film
- strapping materials are used only

2. Container Pallets

Correspond exactly to the standard pallets – however reel stack cores are used for stabilisation during over-seas shipment.
